Recombinant Human $VEGF_{165}$

Description: Human Vascular Endothelial Growth Factor $VEGF_{165}$, a 23 kDa protein consisting of 165 amino acid residues, is produced as a homodimer. VEGF is a polypeptide growth factor and a member of the platelet-derived growth factor family. It is a specific mitogen for vascular endothelial cells and a strong angiogenic factor *in vivo*. Two high-affinity tyrosine kinase receptors for $VEGF_{165}$ have been identified, VEGFR-1 (FLT-1), and VEGFR-2 (KDR). Consistent with the endothelial cell-specific action of $VEGF_{165}$, expression of both receptor genes has been found predominantly but not exclusively on endothelial cells. Expression of VEGFR-1 was also found on human monocytes, neutrophils (PMNs), bovine brain pericytes and villous and extravillous trophoblasts. In addition to its action as a mitogen it is a potent vasular permeability factor (VPF) *in vivo*. $VEGF_{165}$ is also a chemoattractant molecule for monocytes and endothelial cells. 5 different proteins are generated by diffential splicing: $VEGF_{121}$, $VEGF_{145}$, $VEGF_{165}$, $VEGF_{189}$ and $VEGF_{206}$. The most abdundant form is $VEGF_{165}$. Whereas $VEGF_{121}$ and $VEGF_{165}$ are secreted proteins, $VEGF_{145}$, $VEGF_{189}$ and $VEGF_{206}$ are strongly cell-associated. The isoforms $VEGF_{145}$, $VEGF_{165}$ and $VEGF_{189}$ bind to heparin with high affinity. $VEGF_{165}$ is apparently a homo-dimer, but preparations of $VEGF_{165}$ show some heterogeneity on SDS gels, depending on the secretion of different glycosylation patterns. All dimeric forms have similar biological activities but their bioavailability is very different. There is good evidence that heterodimeric molecules between the different isoforms also exists and that different cells and tissues express different VEGF isoforms. The other members of this increasing growth factor family are VEGF-B, -C, -D and -E. Another member is the Placenta growth factor PlGF.

Source:	Insect cells
Molecular Weight:	45 kDa
Purity:	> 90%, by SDS-PAGE and visualised by silver stain
Endotoxin level:	< 0.1 ng per ug of VEGF
Stabilizer:	none
Buffer:	50 mM acetic acid
Formulation:	lyophilised

Biologically Activity: The ED_{50} for stimulation of ^{3}H-thymidine incorporation and cell proliferation by human umbilical vein endothelial cells for $VEGF_{165}$ has been determined to be in the range of 1-2 ng/ml.

Reconstitution: The lyophilised $VEGF_{165}$ is soluble in water and most aqueous buffers. The lyophilised $VEGF_{165}$ should be reconstituted in PBS or medium containing at least 0.1% human or bovine serum albumin to a concentration not lower than 50 µg/ml.

Stability: Lyophilised samples are stable for greater than six months at –20°C to –70°C. Reconstituted $VEGF_{165}$ should be stored in working aliquots at -20°C. **Avoid repeated freeze-thaw cycles!**

Usage: $VEGF_{165}$ is offered for research use. Not for drug use. **Not for human use!**

Catalogue number:	300-035S	**Size:**	2 µg
		Range:	1-10 ng/ml
