

## **SPECIAL PROTEIN PREPARATIONS**

The “*Special Protein Preparations*” give the customer the possibility to get the desired recombinant protein e.g. in a formulation and/or a vial size necessary or with a better fitting to the experimental requirements.

For some experimental settings it is absolutely necessary to have a certain compound in a special formulation, e.g. a recombinant protein used in a iodination reaction should be without a carrier protein like HSA or BSA. Or in addition, it is sometimes more favourable to get the recombinant protein without a carrier protein in a vial size sufficient for one injection in the case of an animal model.

RELIATech offers for pre-clinical experiments or animal testing different vial sizes and products stabilized in the presence of different carrier proteins (e.g. bovine serum albumin, mouse or rat serum albumin) in liquid or lyophilized formulations.

Because this service is not possible for all of our products, please contact us for further information.
